TEAM BRIEFING · BEGINNER GUIDE

How one event travels through the Business Control Tower

From the moment it arrives to its final outcome

Seven workflows, seven jobs

CT-01 Front desk

Receives, checks, scores, asks approval, starts the alert

CT-02 File clerk

Only one allowed to change a case status; writes the history

CT-03 Messenger

Posts the alert to Slack

CT-04 Alarm

Alerts Slack if a workflow itself crashes

CT-05 Night watchman

Every few minutes: retries, finds stuck cases, spots bursts

CT-06 Reopen desk

A person restarts an escalated or failed case

CT-07 CRM note-taker

Would add a HubSpot note. Switched off today

Part 1: Receive, check, open a case

1. Event arrives

An outside system sends POST /ops-events with event_id, timestamp, department, event_type, severity, entity_id, payload

→

2. Checked

Fields valid? Department one of six? Severity LOW to CRITICAL?

→

3. Duplicate?

Same event_id already stored: reply 200 and stop

→

4. Case opened

Saved as an incident. State RECEIVED, then VALIDATING

Invalid event: reply 400, state REJECTED. Valid event: reply 202 straight away, the rest runs in the background.

Part 2: The AI advises, the code decides

AI agent (Gemini)

Writes an impact note: category, impact score 1 to 10, summary, recommended action, affected departments, confidence. It has no tools and cannot act.

Code (fixed rules)

Risk = (severity weight × 15 + impact × 4) × department weight, max 100. Priority P1 to P4 and a deadline (SLA). Decides approval.

Example: HIGH, Logistics, impact 8 gives (45 + 32) × 1.2 = 92. Priority P1, 30 minutes. If the AI fails, a safe default is used.

Part 3: Approval, then the Slack alert

Approval needed?

Yes if severity HIGH or CRITICAL, risk 75 or more, AI failed, or confidence below 0.60

→

Email, 45 minutes

Approver clicks Approve or Reject. State AWAITING_APPROVAL

→

Slack alert (CT-03)

State PROCESSING. Slack accepts: COMPLETED

Approve

Continue to Slack

Reject

REJECTED plus Slack note

No answer

ESCALATED plus Slack alert

No approval needed? The incident goes straight to Slack.

When Slack fails: retry, escalate, recover

Attempt 1 (CT-01)

Three Slack tries fail. RETRYING, retry_count 1, wait 1 minute

Attempt 2 (CT-05)

Watchdog retries. Fails: retry_count 2, wait 2 minutes

Attempt 3 (CT-05)

Fails again: ESCALATED, email and Slack alert

A person (CT-06)

POST /ops-recover with incident_no. Back to RETRYING

The Watchdog also escalates cases stuck for 10 minutes (60 while awaiting approval). Retry succeeds at any point: COMPLETED.

Remember three things

1. The AI advises, the code decides.
2. Only CT-02 changes a status, and it always writes the history.
3. The database is the shared memory between runs.

Normal path: RECEIVED → VALIDATING → AI_PROCESSING → CLASSIFIED → (AWAITING_APPROVAL → APPROVED) → PROCESSING → COMPLETED
